

Terra Concordia — Release Notes

What's new and fixed in the current version

Version 1.1.0 — 2026-06-20

New

- UNIQUE ABILITIES per civilization (passive, active in every mode): Solaris (red) — constructions and wonders cost 2 resources less; Mariteia (blue) — explores ocean and island without spending a worker and reveals +1 hex per Explore; Verdantis (green) — Restore yields double (+1 extra global sustainability and +1 extra VP); Aurifera (yellow) — +1 gold on every market trade and 1 extra Trade action per round (4 instead of 3). Detailed in the Tutorial (Civilizations tab) and the Civilopedia.
- MULTIPLAYER — everyone is informed the same way: sounds AND on-screen messages for every action (collect, build, trade, etc.) now play and appear for ALL players, not just the one who acted; phase summaries (Planning/Production/Maintenance) are identical for host and guests.
- HISTORY in EACH player's language: the match log is re-translated into each player's own language (guests used to see it in the host's language).
- MULTIPLAYER — turn alert: a sound + on-screen notice when it's your turn (at 57s and again at 10s remaining).
- CUSTOMIZE the background color across the WHOLE game (board, panels, top bar, windows/modals and menus): 12 palettes — Classic (default), Nocturne, Bronze, Forest, Wine, Slate, Ember, Midnight, Jade, Rose, Obsidian and Plum — in Settings.
- Defeat/collapse video shown to every losing player; victory video only for the winner (any mode). Videos play before the end-of-game screen.
- When raising a Wonder, the hex animation plays FIRST and the fullscreen video opens right after (a short delay so you see the wonder rise).
- 13 procedural music tracks selectable in Settings !' Sounds — 7 orchestral ambiances with NO beat (Serene, Epic, Mystic, Pastoral, Oceanic, Twilight, Ceremonial) + 6 WITH beats and distinct rhythms (March, Tribal, Pulse, Festival, Tavern, Gallop). Default for new players: March.
- Help menu: "Release Notes & Latest Updates" (this PDF).
- Main menu: "Manuals & Website" (opens the site in the current language) and "Discord Invite" buttons.
- Version and build date shown on screens outside the game.
- Animation pack: floating numbers, worker "pop", animated hex reveal, pulsing ring on the active player + glow on the selected action, shake/spark on the Sustainability bar.
- Redesigned main menu: no frame, reordered buttons with emojis, "Quit" in the bottom-right corner; the Civilopedia button now opens the in-game guide.
- Unexplored hexes twinkle with 4-point golden stars and a soft halo (replacing the old dots).
- Full keyboard play: Tab moves between panels and buttons, Enter/Space activates. New tutorial tabs: "Shortcuts", "VP Breakdown" (how points are counted) and "Strategy" (how to score more).
- Larger AI difficulty selector and a more prominent "play against AI" toggle; the Research modal zooms the card on hover.
- Redesigned, prettier in-hex icons, all the SAME size: construction (little house), worker (hard-hat laborer) and the navigation boat. The victory-point badge (star + number), the hex owner marker, the influence disc and the wonder were repositioned so they never overlap.
- Sidebar workers shown as worker emojis (green = free, dimmed = placed or exhausted).
- AI: when playing against the AI, every AI action's SOUND, EFFECT and MESSAGE now plays for all players (solo and multiplayer). Previously, AI actions went by silently with no indication.
- AI: the AI now waits 3 seconds before each of its actions so you have time to read/hear what just happened.
- End-of-game screen with ANIMATED scoreboard category by category: each VP source adds a little to each player's running total (timed count-up, ~700 ms between categories). The winner and fanfare appear only at the very end of the animation — suspense up to the last number.

- Cards TRB-01 (Master Architect) and PRO-15 (Master Plan) now ACTUALLY allow 1 build per round without spending a worker. The Build button enables even with 0 free workers as long as this bonus has charges left.
- Card EXP-10 (Technological Artifact) now grants a TRUE free research: the next time you Research a level-1 technology, it costs no resources. Previously the "free research" was simplified to a tech draw.
- CON-19 (Transmission Tower): the "doubled influence action" now grants +1 VP immediately each time you use Influence (the flag was read but never applied).
- CON-03 (Granary): +5 storage capacity (10 ! 15) now works — previously the cap stayed at 10 despite the card text.
- Alliance (Diplomacy variant): the +3 gold bonus is now paid only when the alliance ends peacefully (not on formation) — closes an exploit that allowed repeatedly forming/dissolving alliances to generate gold from nothing.
- PRO-10 (Island Colony): internal fix for a duplicated computation when revealing islands.
- Fixed: during the AI's turn (including the 3 s wait), the human player's action buttons and hand cards are now DISABLED — previously you could "play for the AI" before the 3 seconds.
- OBP-09 "Guardian of Nature": now measures REAL contribution to global sustainability (how many times you Restored), instead of tying with another objective's individual track.
- INF-06 "Council of Sages": now draws 2 INFLUENCE cards (correct deck) and grants +1 influence per influence card you already have in play.
- EXP-07 "Ancient Inscriptions": now actually grants a level-1-2 technology (level filter applied).
- COM-02 "Favorable Exchange": no longer a trap card — it now actually yields +4 gold.
- COM-08 "Market Speculation": no longer luck-based (was a 50% coin flip) — guaranteed +8 gold return.
- INF-08 "Spy Network": text corrected to reflect the real effect (steals 1 random card from a rival).
- AI (solo): fixed a freeze where, if the human passed before the AI, the AI took only 1 action and the game hung. The AI now plays all of its turns normally.
- IMMEDIATE bonus of constructions, technologies and wonders is no longer applied twice: several "on build/research" effects granted the gain double (e.g., CON-19 gave +4 influence instead of +2; some wonders/techs doubled sustainability, resources or cards). Each bonus now applies once, matching the card text.
- Target-picker labels (Embargo, Boycott, Partnership, Spy) now appear translated in English and Spanish (they used to show in Portuguese).
- Multiplayer: removed a second action listener that ran without the host identity validation (anti-cheat hardening).
- End-of-game screen is more robust: the winner reveal is guaranteed even across multiplayer re-syncs.
- OBJECTIVE scoring fix (CRITICAL): 3 objectives measured the wrong metric — "Admiral" and "Prodigy Scientist" awarded points almost for free (could change the winner). Each objective now uses the correct criterion. The "Ancient Map" exploration card now grants the +1 VP it was missing.
- Cards with "per round" effects (Embassy, Silk Road, Natural Spring, Abandoned Mine) now actually pay out each round, as the text says.
- Metallurgy and Energy Crystals technologies now apply the promised build-cost discounts; cards whose active effects did not exist (Alchemy, Workshop, Medicine, Royal Road, some special workers) had their text/effect aligned to what they do.
- The AI now plays self-beneficial hand cards (exploration/workers) instead of leaving them unused.
- AI rebalanced: because the AI is now stronger (plays cards, with discounts and per-round income fixed), its starting VP head start was reduced — Easy +10, Normal +30, Hard +50 (was 20/45/70).
- EN/ES card translations synced: several re-texted cards (Favorable Exchange, Market Speculation, Alchemy, Medicine, Workshop, Royal Road, Embassy, Trade Routes, Trade Network, Royal Marriage, Intrepid Explorer, Skilled Diplomat, Hydraulic Engineer) still described the old effect in English/Spanish — they now match the real effect.
- Manuals, physical manual, solo manual and Civilopedia (PDF and DOCX, PT/EN/ES) plus the in-game tutorial were regenerated with the updated values and texts.

Achievements

- Win-only achievements unlock only on an ACTUAL win — never when losing in solo (scenario goal respected), losing to another player, or losing by ecological collapse.
- Civilization achievements unlock when winning with that civilization in any mode.
- "Perfect Balance": win with Global and Individual Sustainability at 10. "Diplomat" and "Path of Peace" now track the Influence ACTION.
- "Hard Mode Win" requires AI in the match; "Diplomacy 4 players" uses the initial human count.
- Winning because an opponent left or dropped (forfeit) NO LONGER unlocks achievements that require winning the match.

Fixes

- Multiplayer (Steam): opening "Join match" BEFORE creating one now shows the waiting matches right away (previously you had to create a match first to see the others).
- Phase-summary titles now appear in each player's language (they used to show in Portuguese for everyone).
- Wonders no longer count toward the building upkeep tax — raising wonders no longer increases your maintenance cost.
- Stealing a card (INF-08) with a full hand no longer destroys the card: it is returned to the target instead of vanishing.
- Building as a guest no longer makes the card "flicker" (disappear and come back) when you hit the 3-builds-per-round limit.
- Stronger, more consistent AI: it follows its script correctly in any language and no longer forfeits its remaining turns over a single per-round limit.
- The "most production" public objective now measures real production (producing workers) instead of the capped resource stockpile.
- Resource overflow converted to gold is summed correctly when a single action grants several resources.
- Multiplayer stats (Steam achievements for hosted time, reconnection and no-AFK) are no longer overwritten on the guest.
- Solo / vs-AI: cards that depend on other players / human cooperation are removed from the decks.
- Videos no longer play at the same time as music/SFX — game audio is muted while a video plays.
- Multiplayer: turn timer respects the disconnect pause; residual state (discard/timeline) reset each new game; winner computed via the full ranking (host and guest aligned); anti-cheat on discards; error feedback when accepting an alliance; ecological collapse ignores players who left.
- Multiplayer chat removed (store content policy).
- Many translations (PT/EN/ES): HUD, alerts, history log (maintenance/planning/production), turn labels, discard, navigation, diplomacy and end of game.
- Unexplored hexes show fog (instead of "?"); correct icon on the "Public Objective Led" notice.
- Slightly taller Global Sustainability bar; wider Settings window; footer with correct version; manuals link (PT) fixed.
- Each mode runs its correct number of rounds; intro and victory videos updated.
- Scoring: an achieved secret objective now correctly adds its VP (it was worth 0 before). Conditional card VP (per alliance / per player with less influence) is computed correctly, without double-counting.
- Player-interaction cards implemented/fixed: Embargo, Boycott, Partnership, Monopoly, Trade Routes and Military Alliance (immunity to negative events).
- The AI now explores hexes in random directions (no longer always toward the same side).
- Action buttons no longer stay "stuck" in focus when switching actions; subtle background even when inactive. The "show owner inside hex" option now starts off.
- Saves are now written to "Terra Concordia\saves" (compatible with Steam Cloud); saves from older versions are migrated automatically.
- Multiplayer: the host reliably ends the match when another player leaves or drops — a "heartbeat" detects abrupt disconnects. Remaining players see a notice of who left before the scoreboard and on the final screen.

- End-of-game screen no longer shows blank rows — only the filled score lines.
